

A photograph of an airport tarmac at dusk or dawn. On the left is a large airport terminal building with a glass facade. In the center, a group of ground crew members are walking across the wet pavement. On the right, a Finnair Airbus A320neo aircraft is parked at a gate, with its boarding stairs extended. The sky is overcast and the overall lighting is dim, creating a moody atmosphere.

Case Finavia: Optimal airport

FINAVIA

KITILÄ

(Home of Santa Claus)

Crazy **peak times**
Very limited **capacity**

Pen & Paper

Airports' operations are built around **parking plans**

CASE KITTILÄ:

How do you assign 58 flights to 12 parking stands?

Parking planning is manual expert work.

In Kittilä, the next day's plan is done the night before which takes about 3 hours during the peak season.

Challenge #1:

Rules and regulations

Bigger airports use dedicated rule-checking software,
smaller airports handle everything manually.

Challenge #2:

Restricted resources

Stands, buses, check-in counters, staff, ...

Challenge #3: Preferences

Transfers, walking distances, efficient use of resources,
airlines' wishes, ...

Challenge #4: **Uncertainty**

Passenger amounts are not usually known beforehand

Challenge #5:

Unpredictable changes

Flights may be (usually are) delayed or arrive too early
which may snowball into chaos

Challenge #6:

Problem dimensions

Even mere 58 flights assigned to 12 stands leads to

10^{31} possible plans

To compute all the alternatives would take billions of years
even with a supercomputer

A person wearing a red beanie and a brown jacket is seen from behind, holding a camera. They are standing in an airport terminal, looking at flight information screens. The screens display flight numbers, destinations, and times. The text "The parking of airplanes is a constant battle against time" is overlaid on the image.

The parking of airplanes is
a constant battle against time

Kittilä: Old way of working

How much staff is needed?

How many buses are needed?

When should the check-ins begin?

How robust is this plan?

A Finnair airplane is parked on a snowy tarmac at dusk. The sky is a mix of dark blue and orange, suggesting sunset or sunrise. The ground is covered in snow, and there are some airport signs visible in the background. The text is overlaid on the image, with 'optimal parking plan' in yellow and the rest in white.

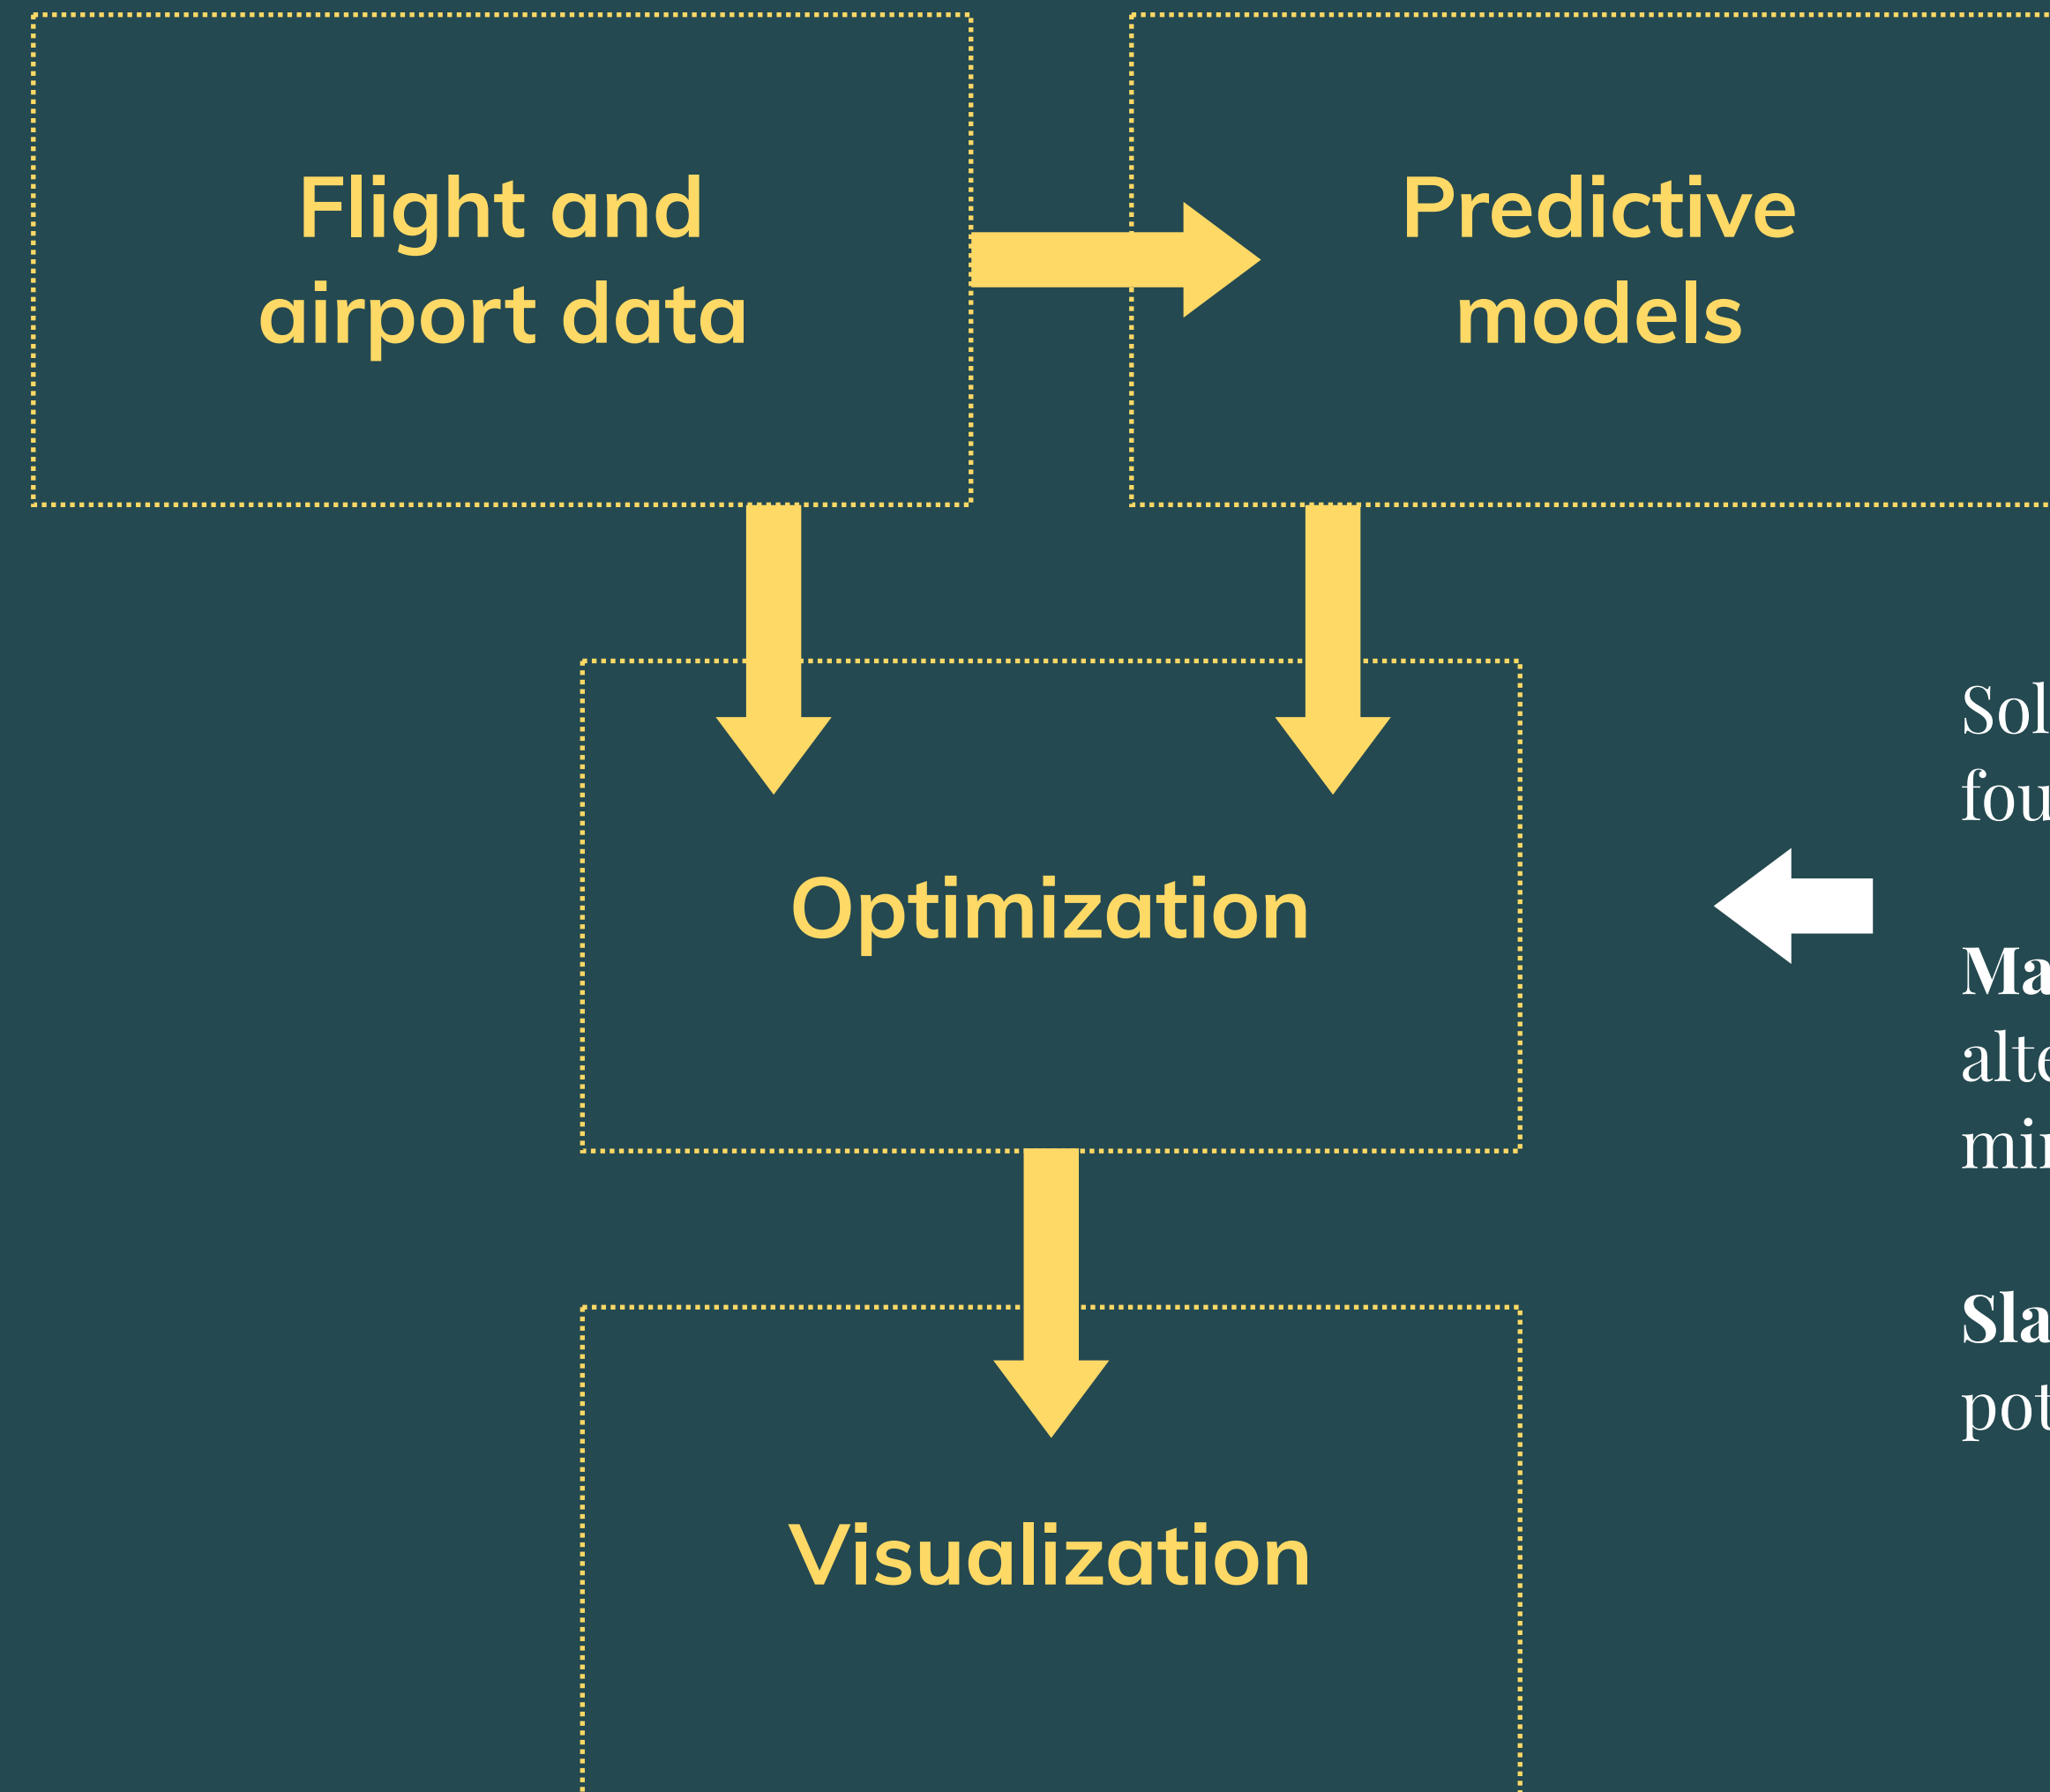

What if the
optimal parking plan
could be solved mathematically?

A Finnair airplane is parked on a snowy tarmac at dusk. The sky is a deep blue, and the ground is covered in snow. The airplane's tail features the Finnair logo. In the background, there are some trees and airport infrastructure.

Well it can:
we created a linear optimization model for parking, making Kittilä

**the world's first
AI-optimized airport**

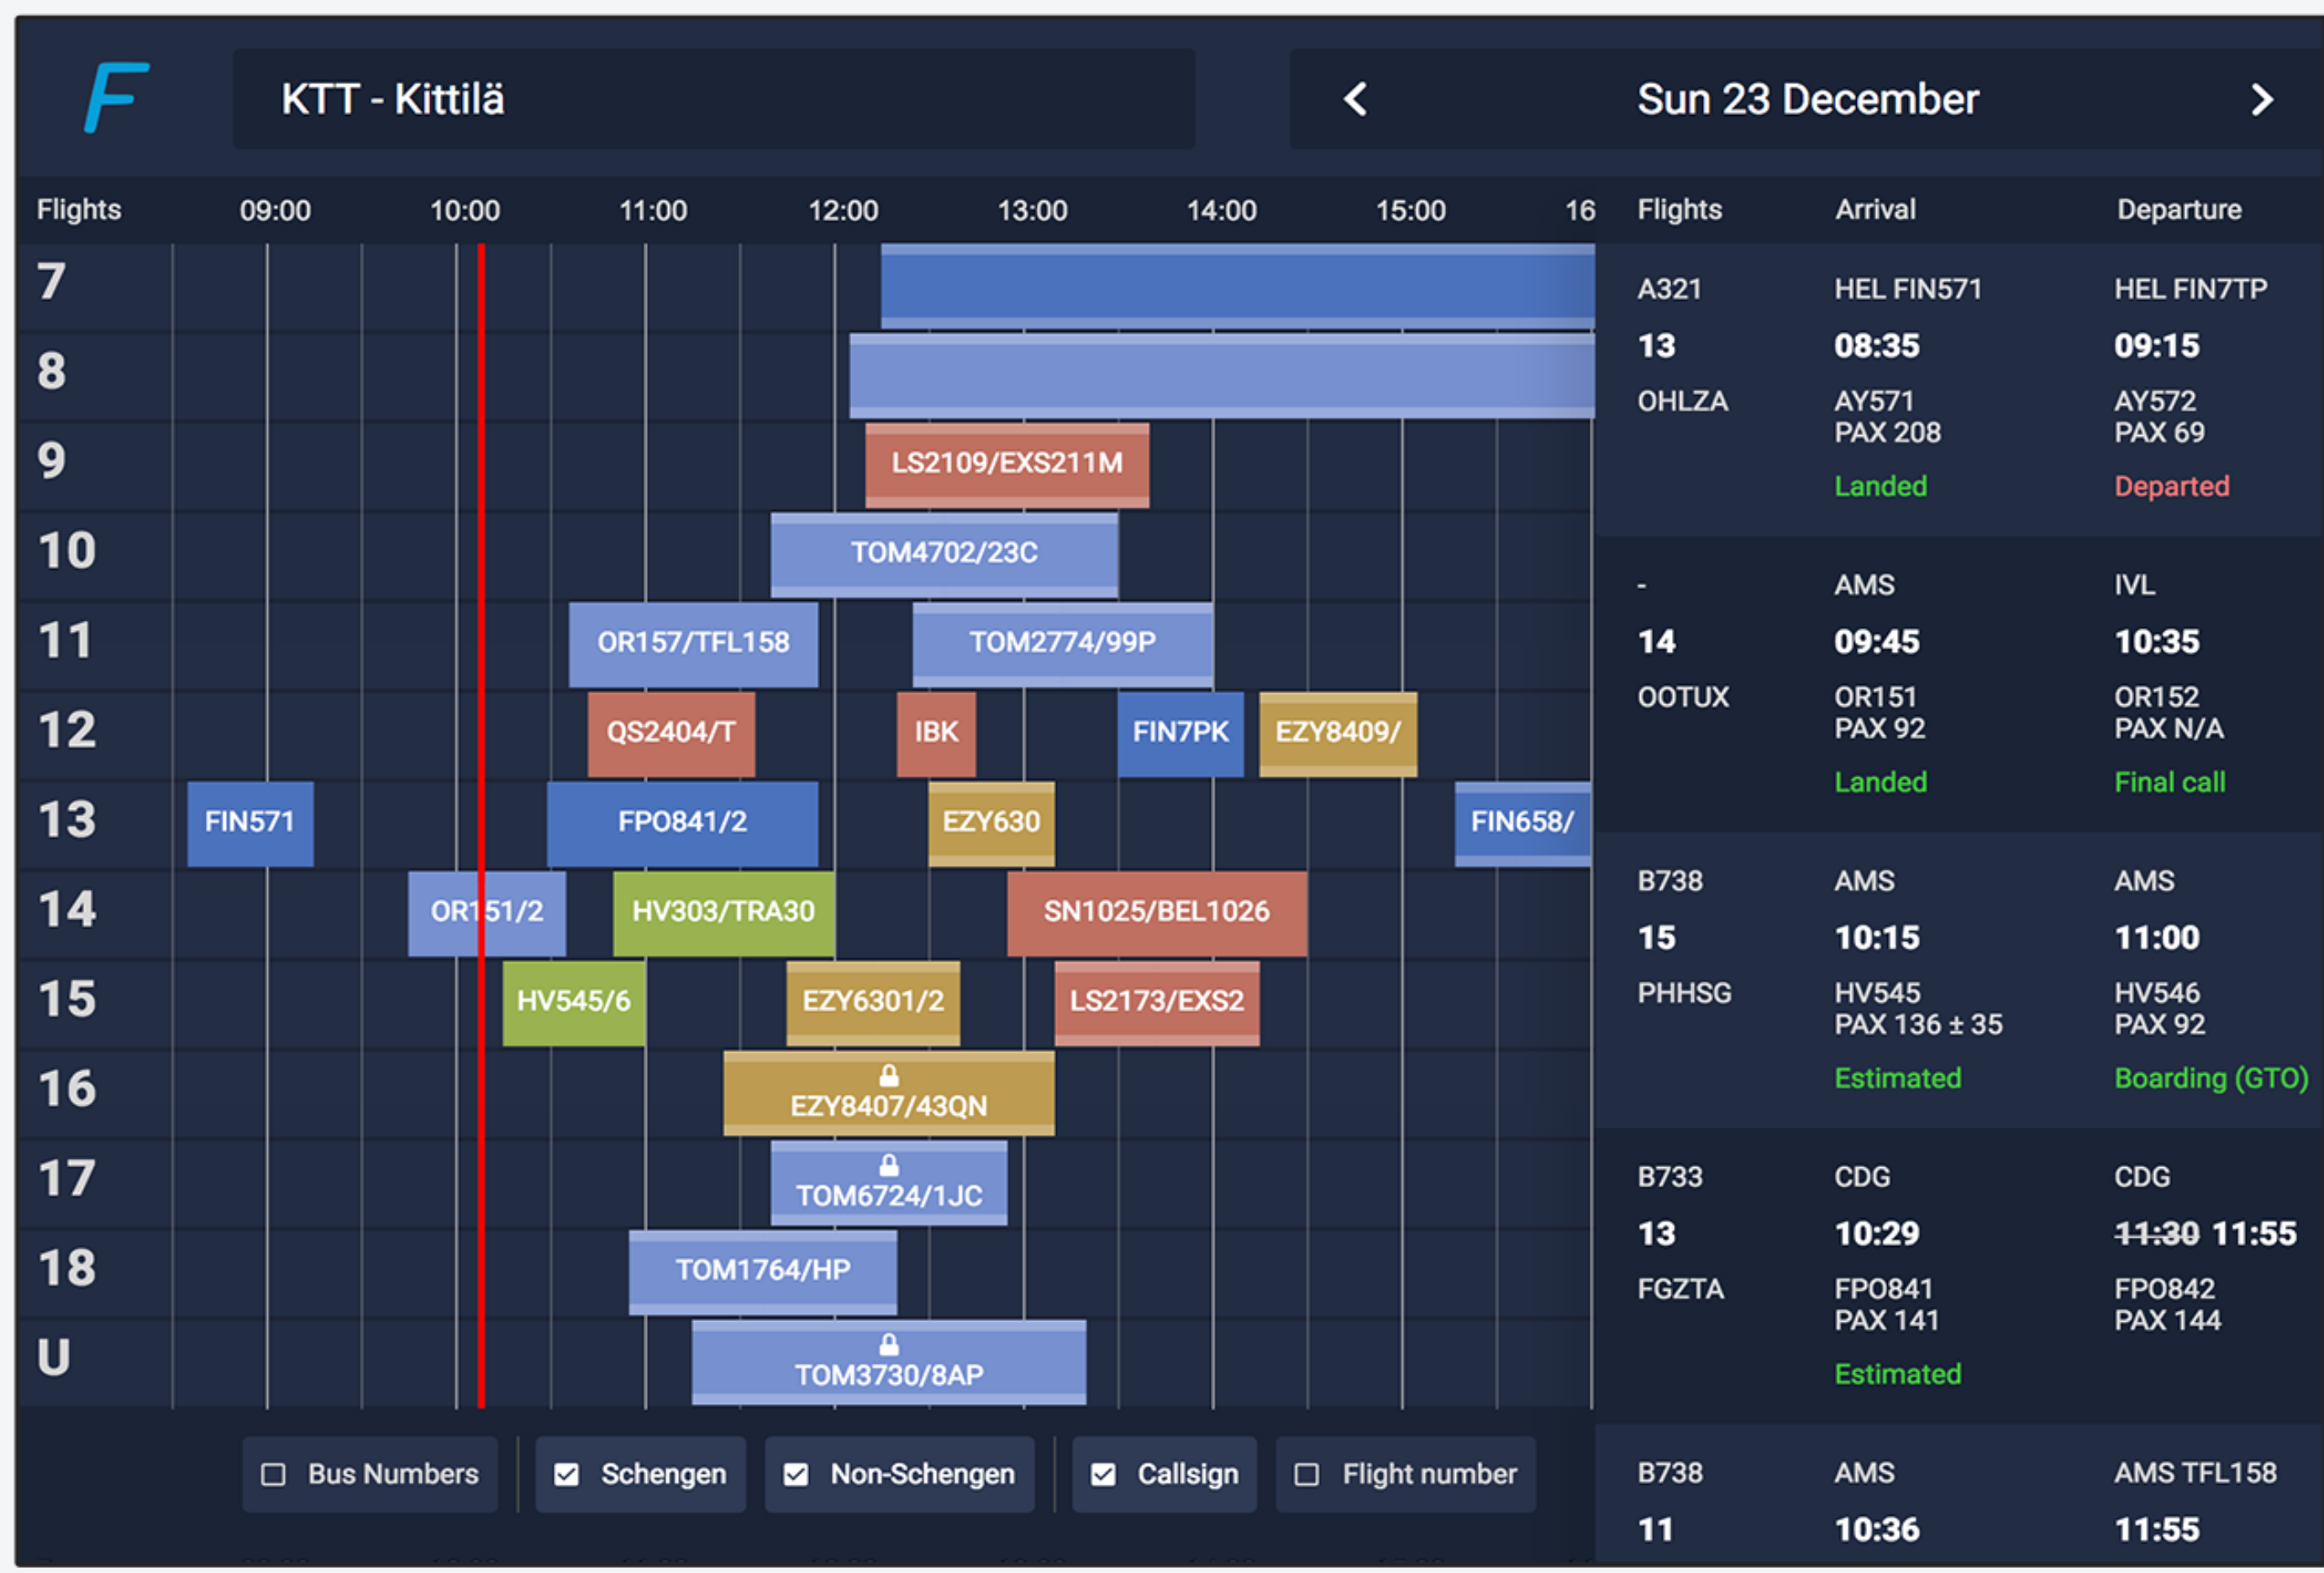

SOLUTION:

Solved iteratively until better alternatives can no longer be found:

Master problem: From the already generated set of alternatives, find the best possible combination by minimizing the total cost

Slave problem: Find new alternatives that have the greatest potential of reducing the total cost of the master problem

Solution #1:

Rules and regulations

Incorporated as optimization constraints that are
inherently taken into account

Solution #2:

Restricted resources

Incorporated as optimization constraints that are
inherently taken into account

Solution #3:

Preferences

Incorporated as additional costs affecting
the plan optimality

Solution #4: Uncertainty

Predictive models of the uncertain variables for
data-driven decisions instead of a hunch

Solution #5: Unpredictable changes

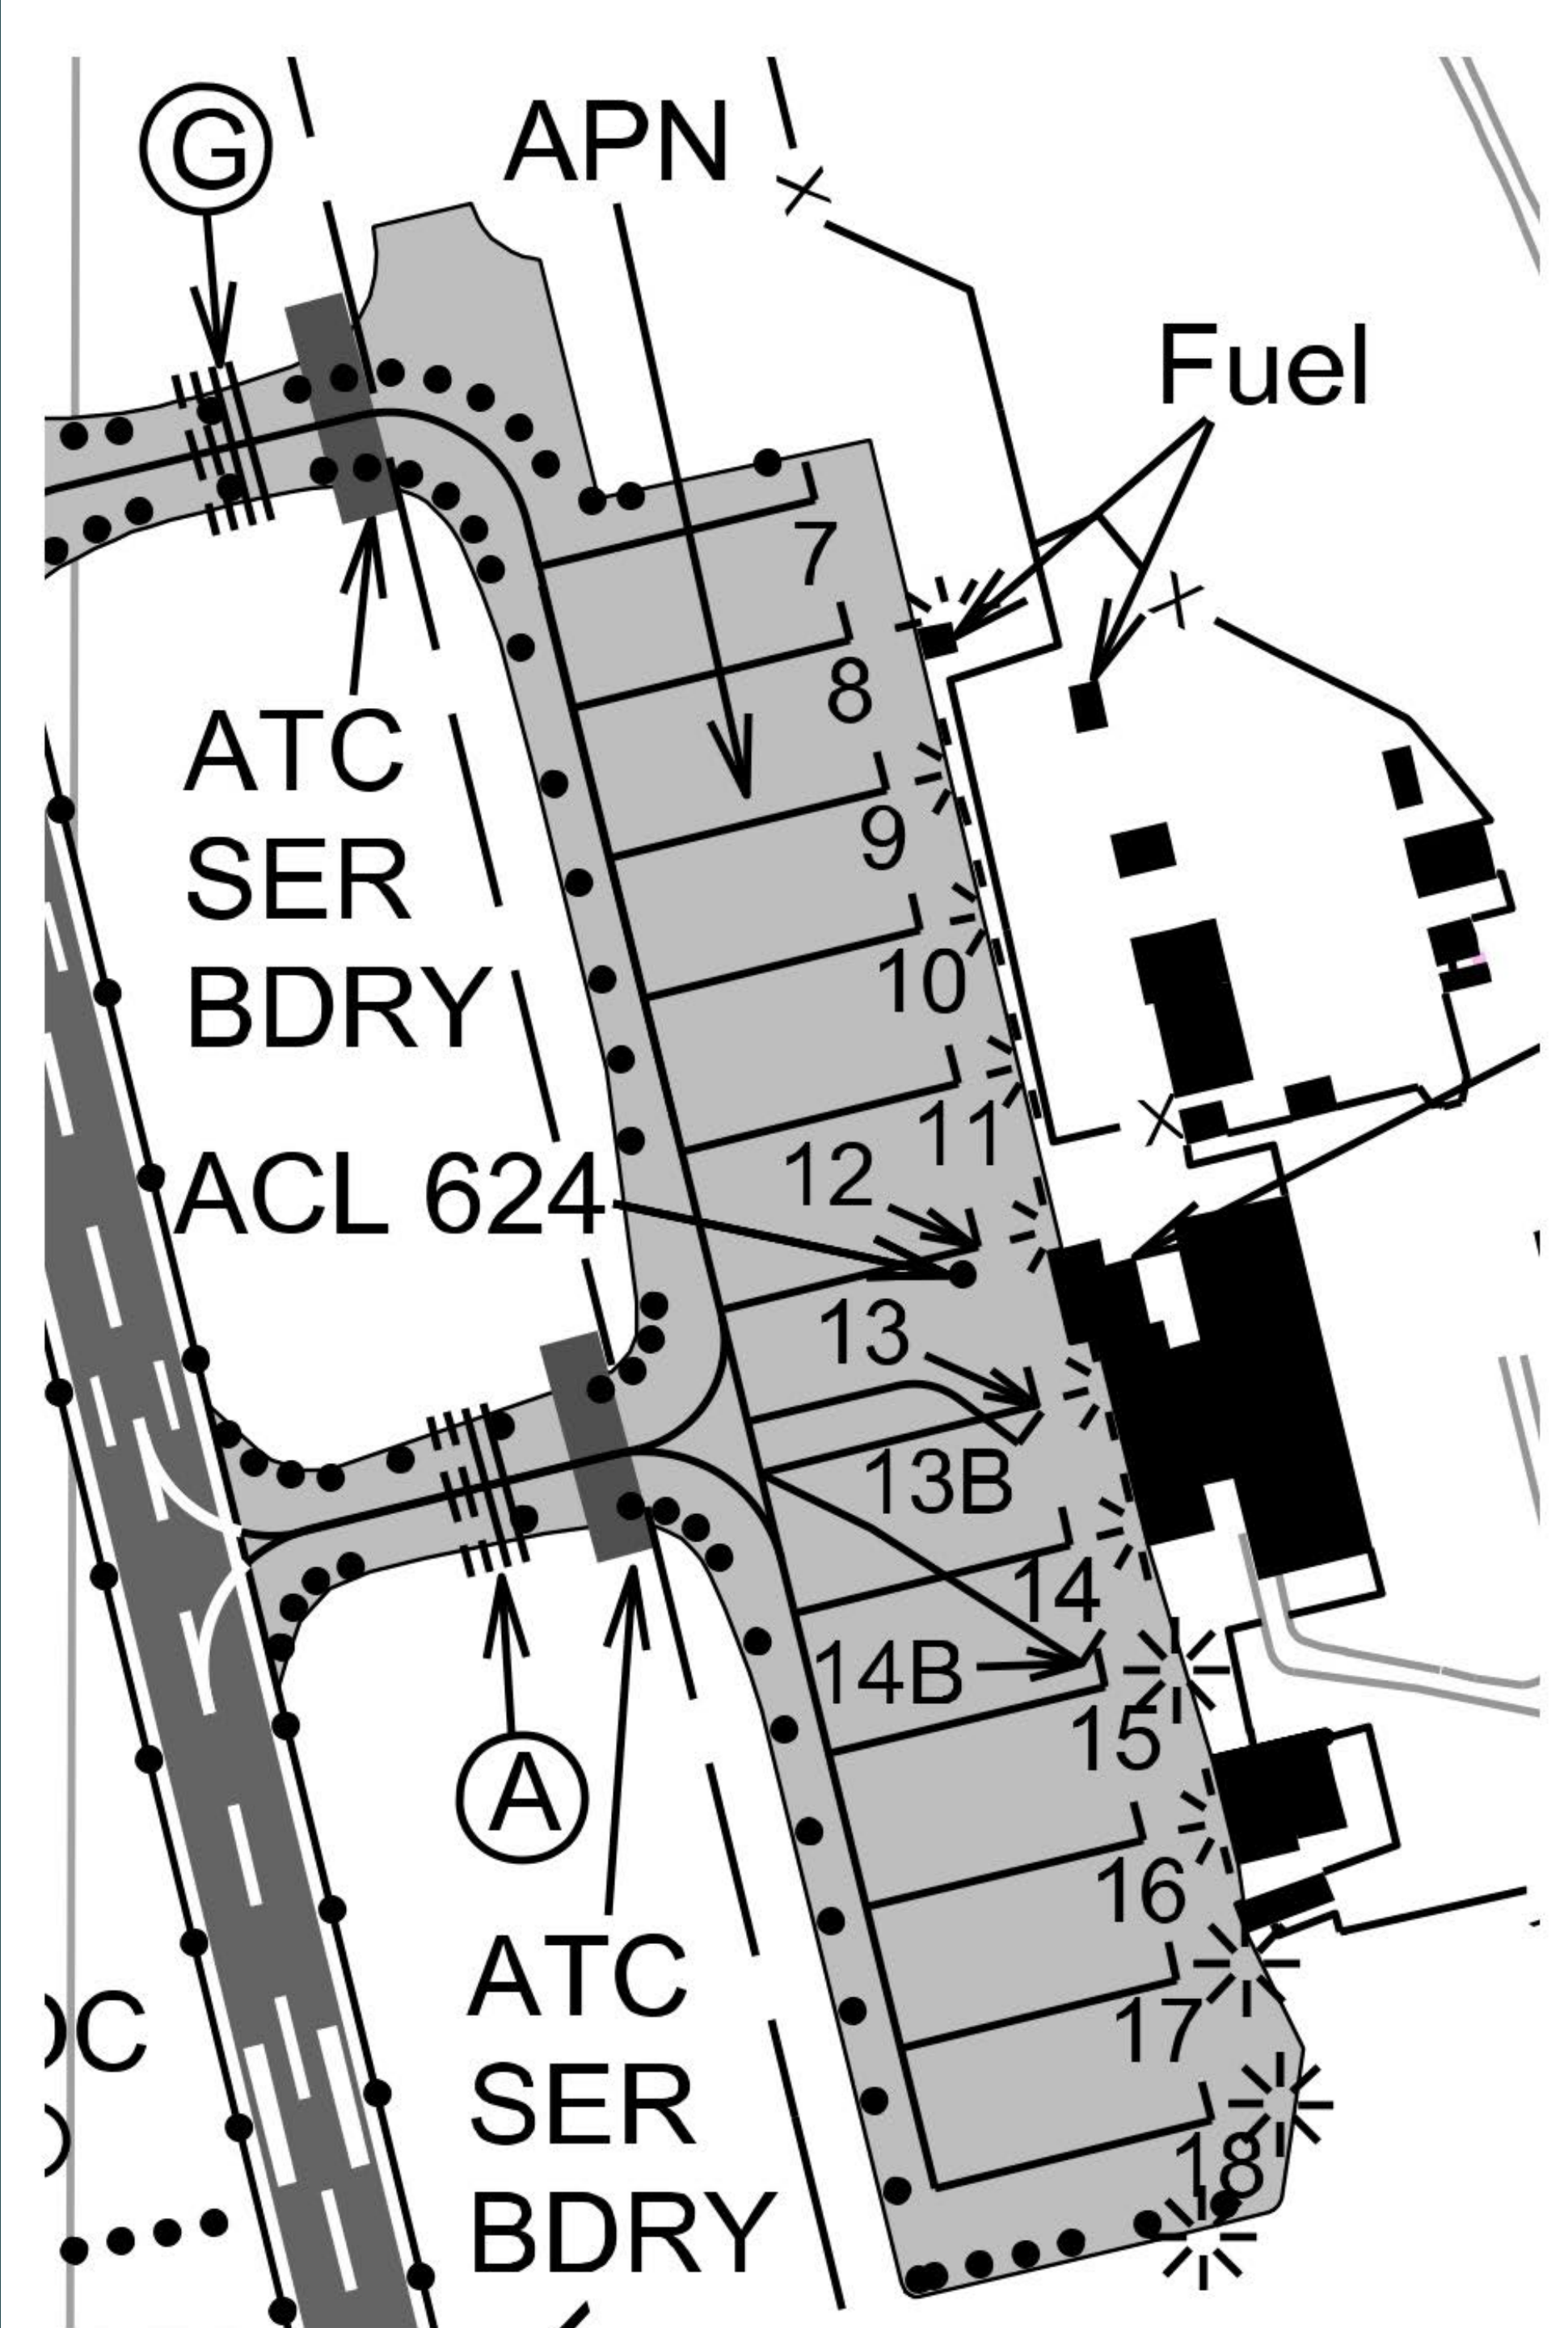

Inherent robustness against changes by using it as an optimality
criterion

If needed, an updated optimal plan can be generated with the
click of a button

Solution #6:

Problem dimensions

Convergence to the best solution in less than 30 sec on
a desktop computer through a tailored optimization
algorithm

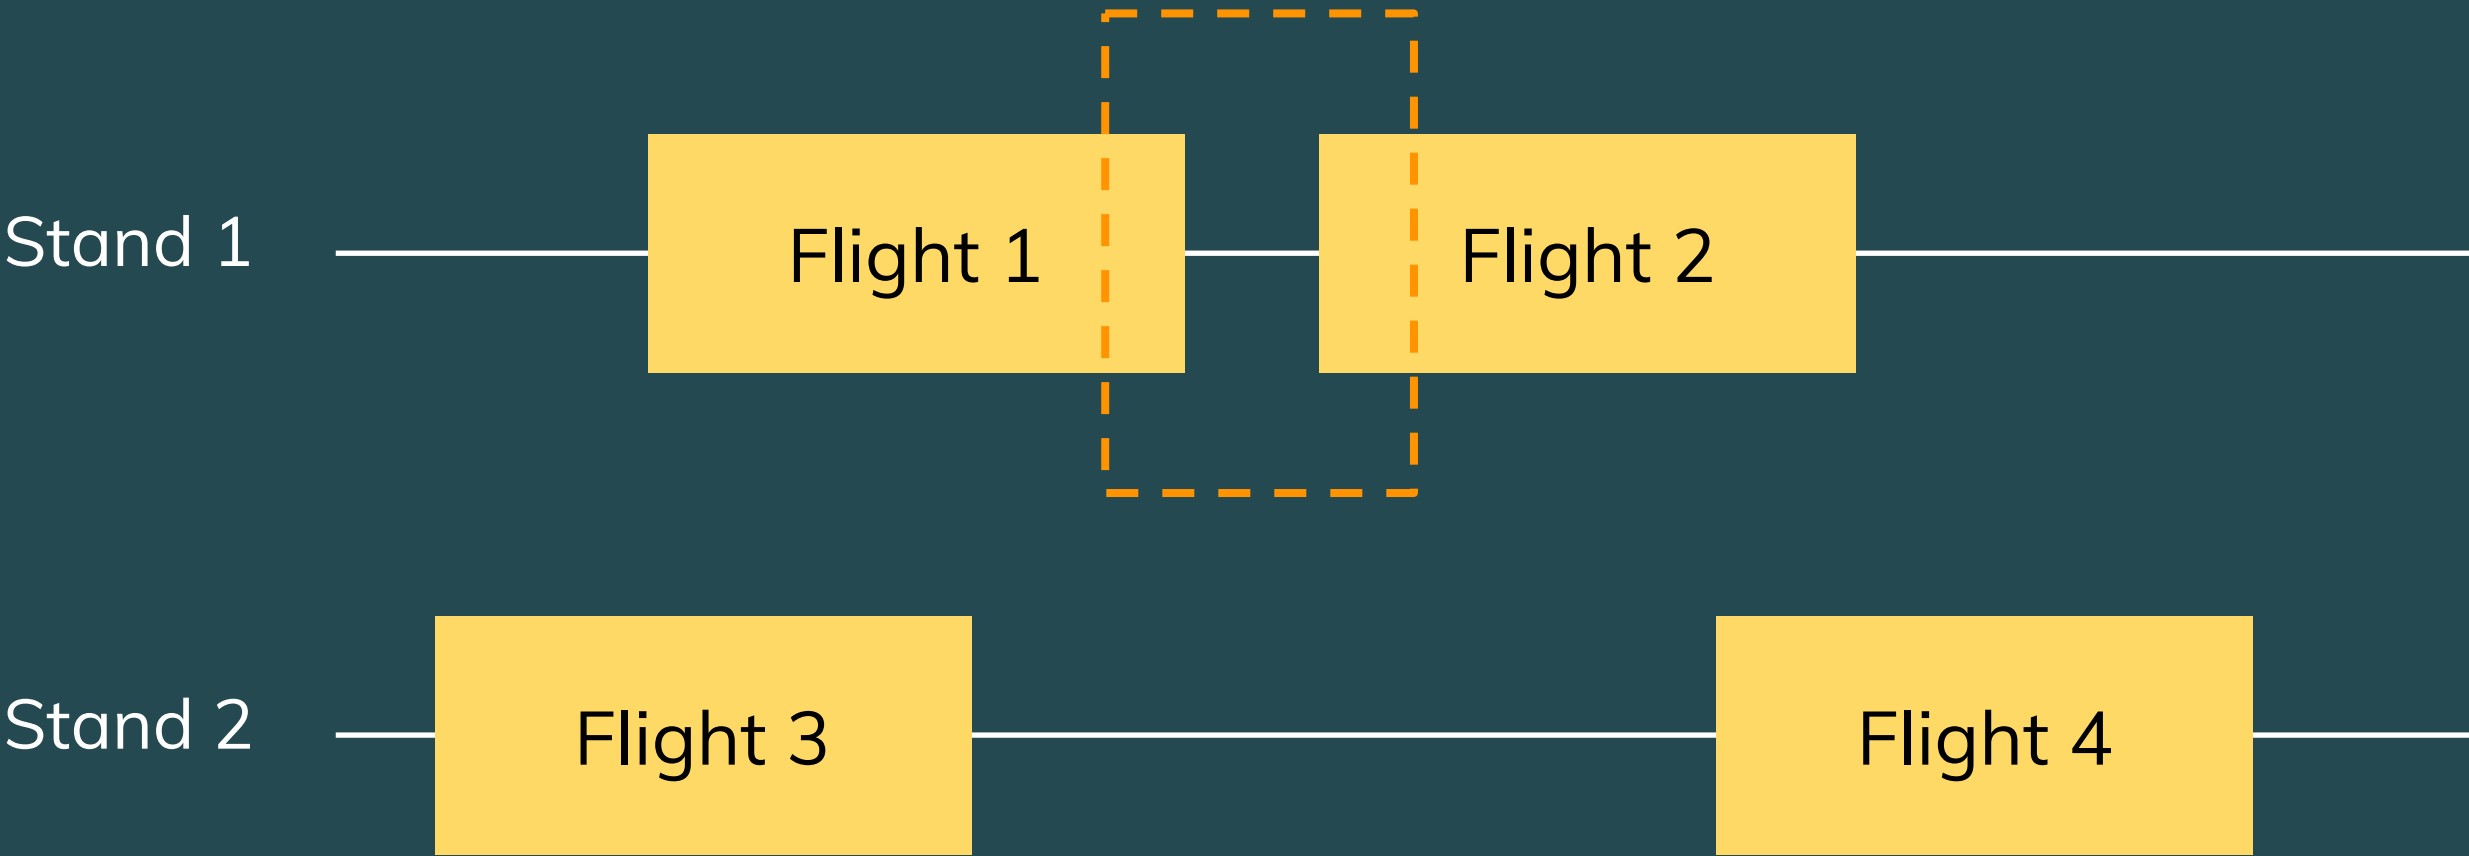

Optimization criteria:

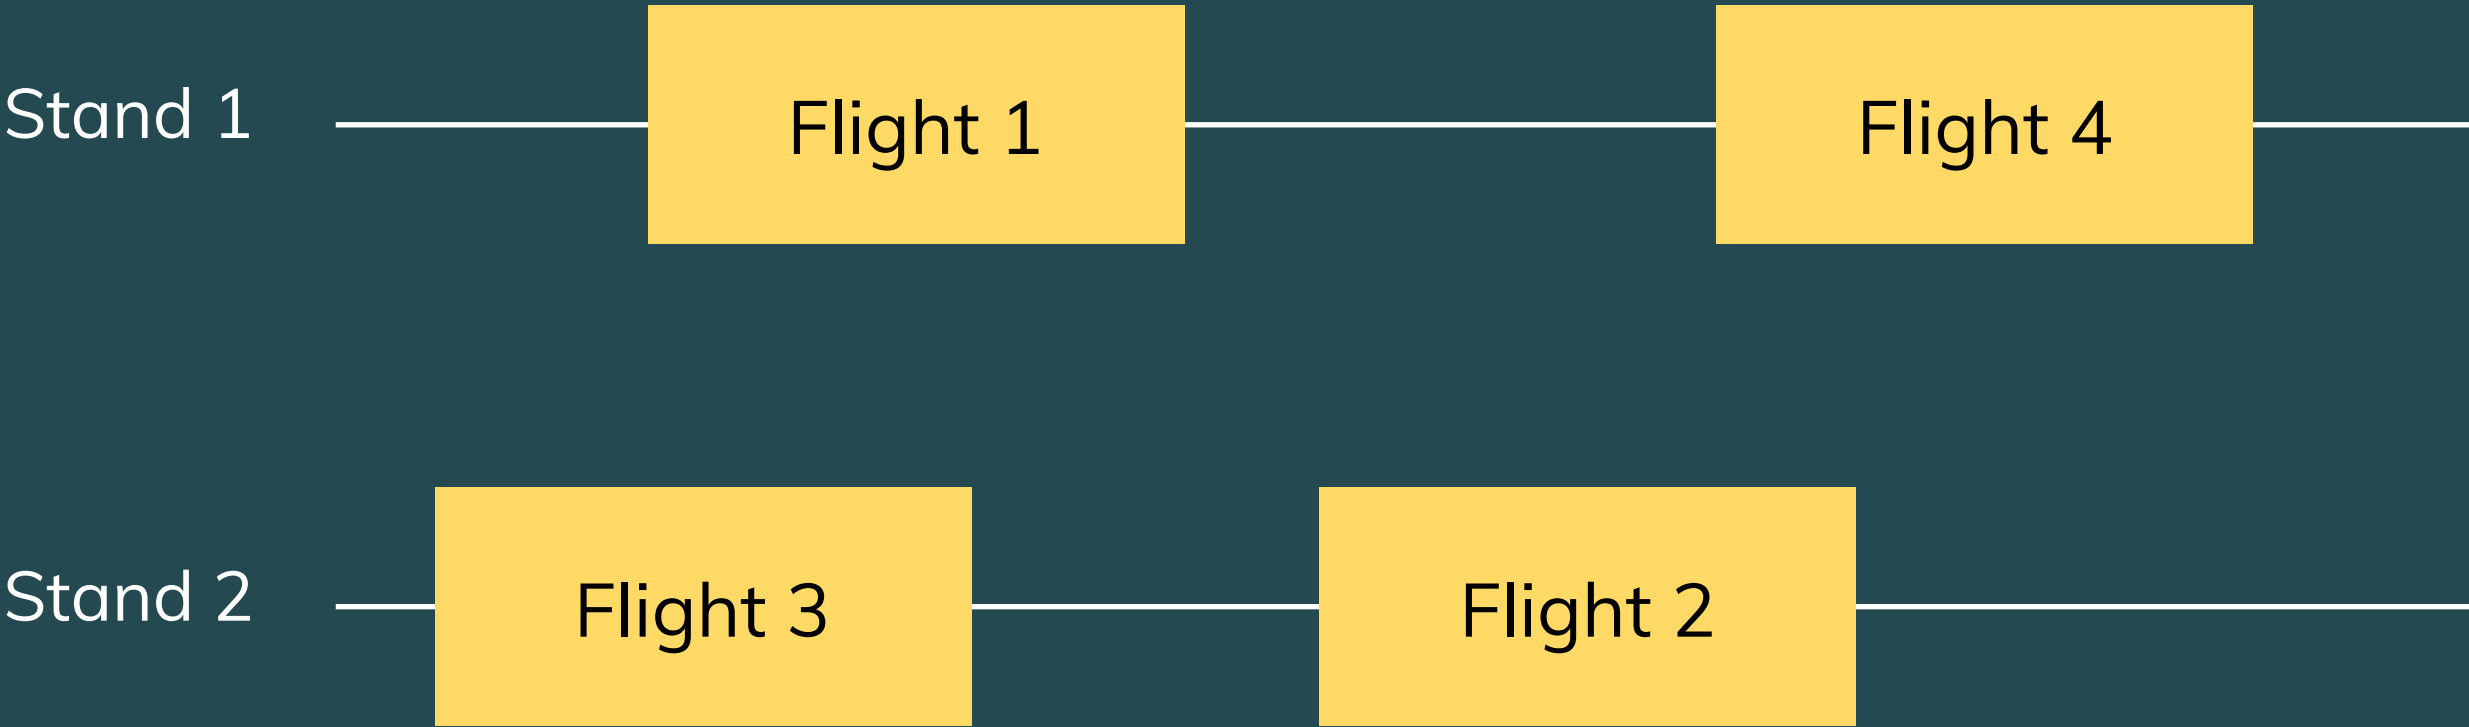

Robustness
&
**Minimal number of bus
transportations**

Plan robustness

Non-robust:

Robust:

Kittilä 2018/12/23

Optimized with respect to **robustness**

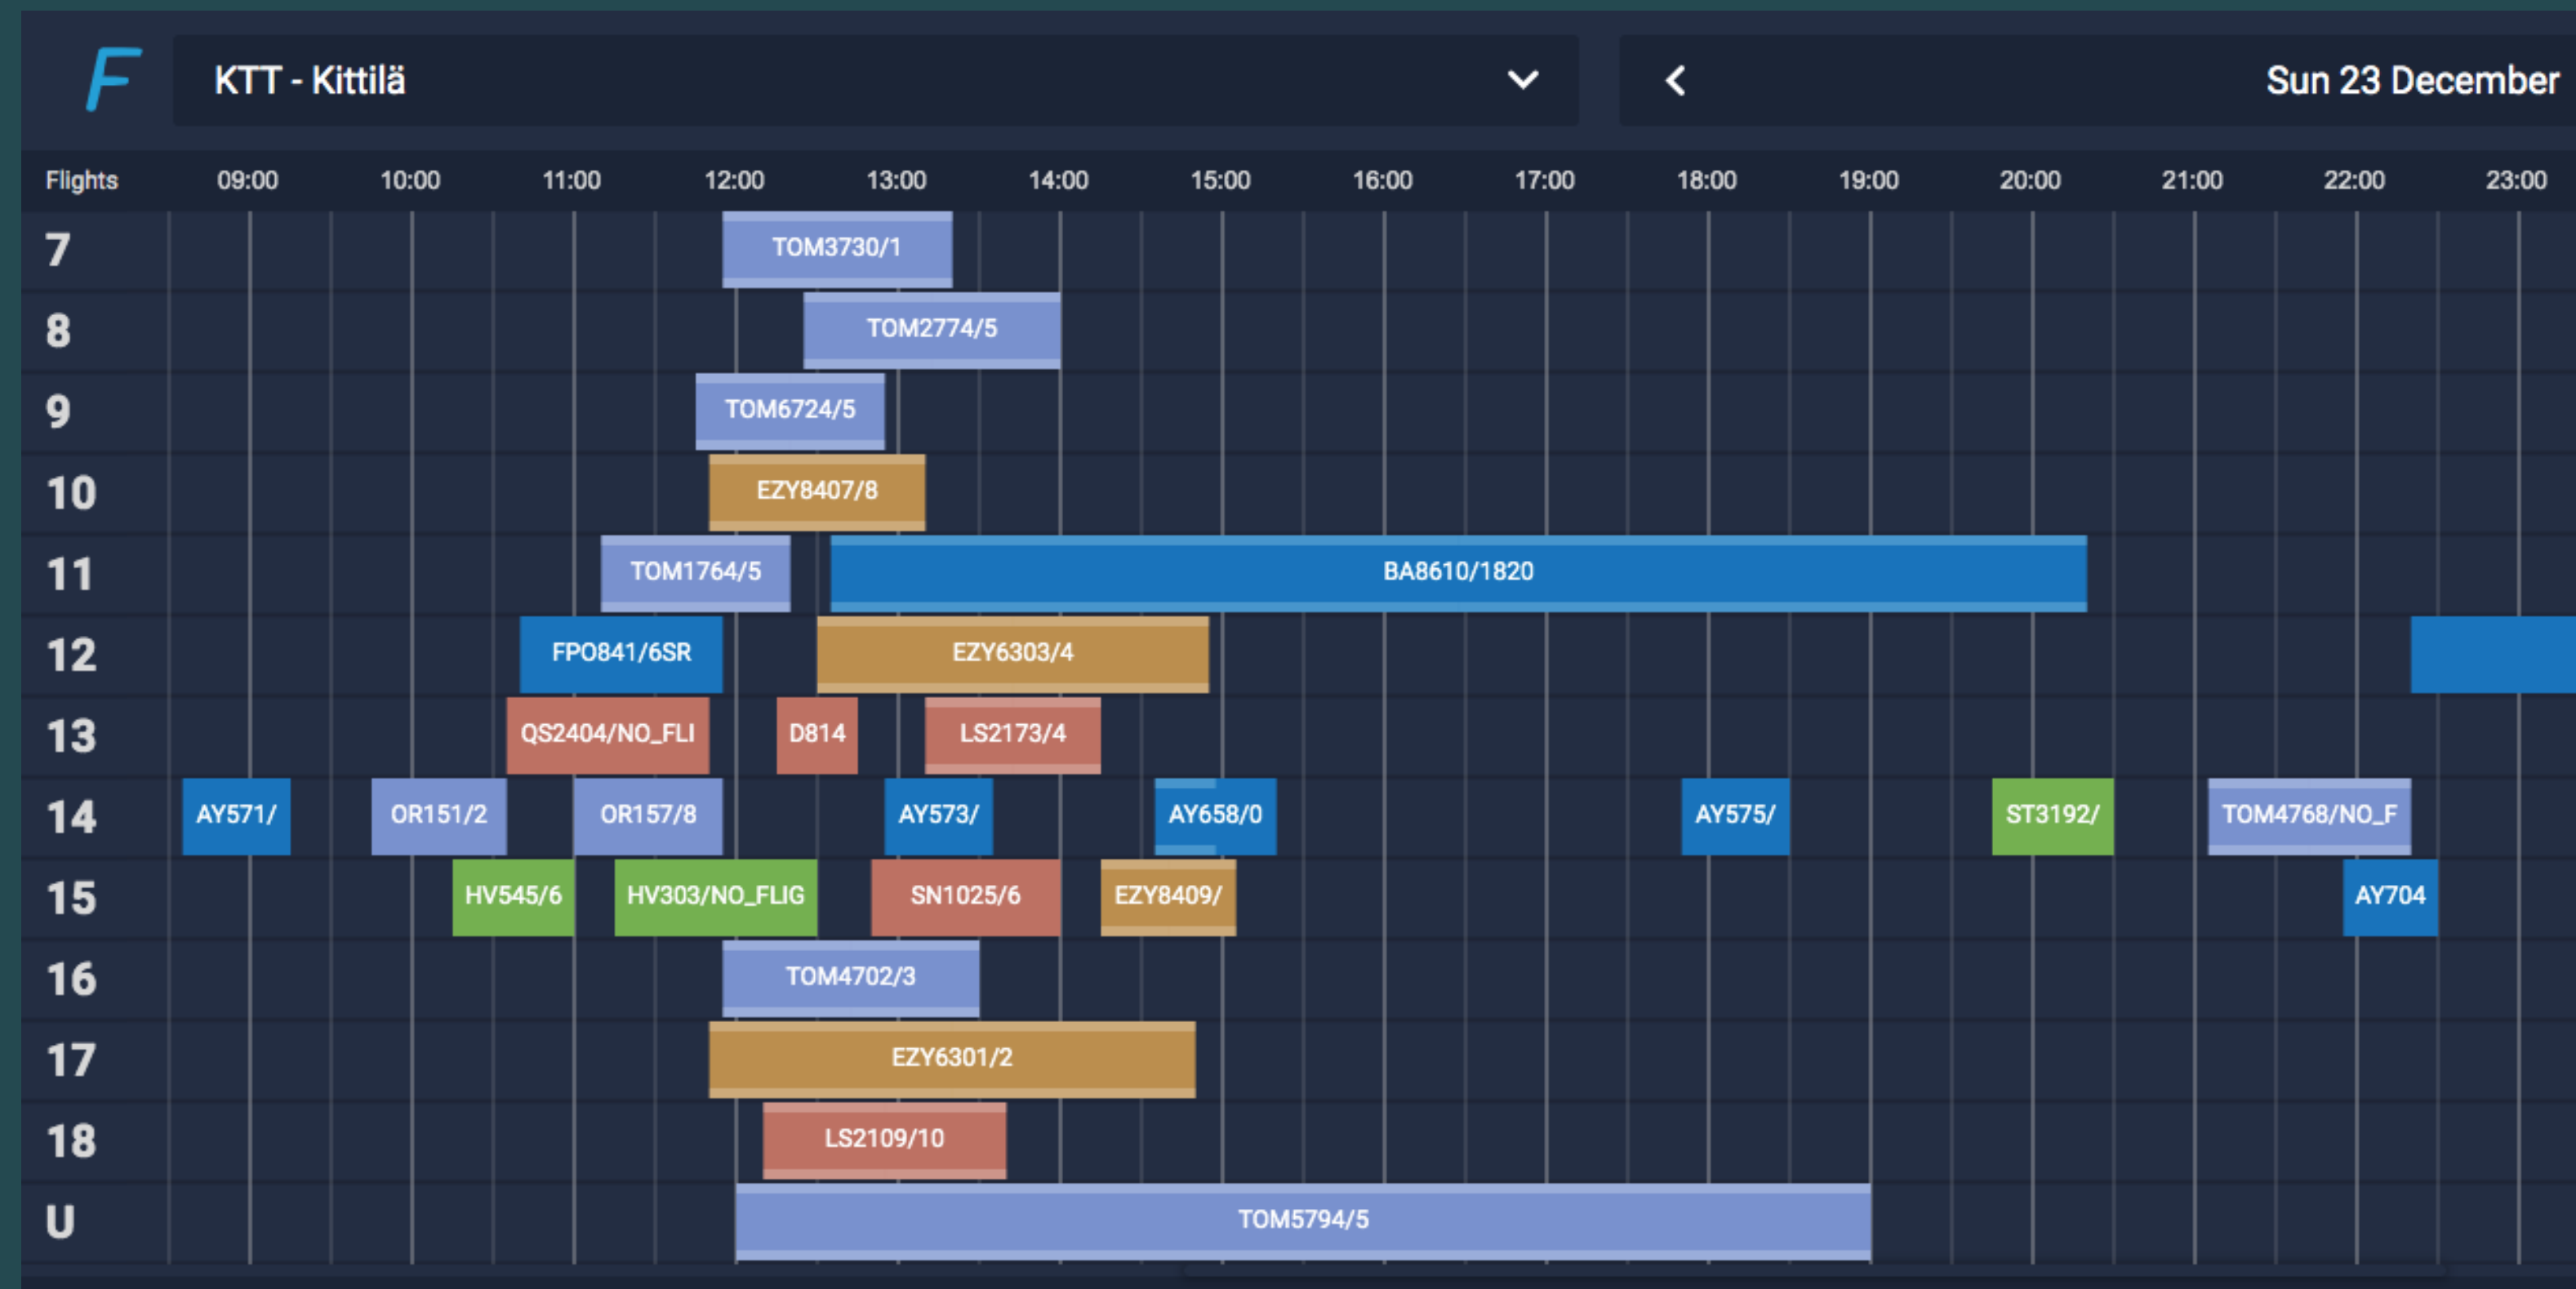

Time between flights is distributed as evenly as possible

Plan requires 64 bus transportations

Kittilä 2018/12/23

Optimized with respect to required **bus transportations**

Plan requires 38 bus transportations

Plan is sensitive to changes!

Kittilä 2018/12/23

Optimized with respect to **robustness and bus transportations** (weights 50%-50%)

Requires 42 bus transportations

Results

The solution was deployed in December 2018. When comparing December 2018 with December 2017:

The number of flights
increased by **12 %**

The decrease in delays resulted in an
estimated **500 000 €** cost savings

Duration of average airport-related
flight delay decreased by **66 %**

The share of airport-related
flight delays decreased by **61 %**

The airport's NPS score increased by **20 points**
