Real-Time Economy as a concept

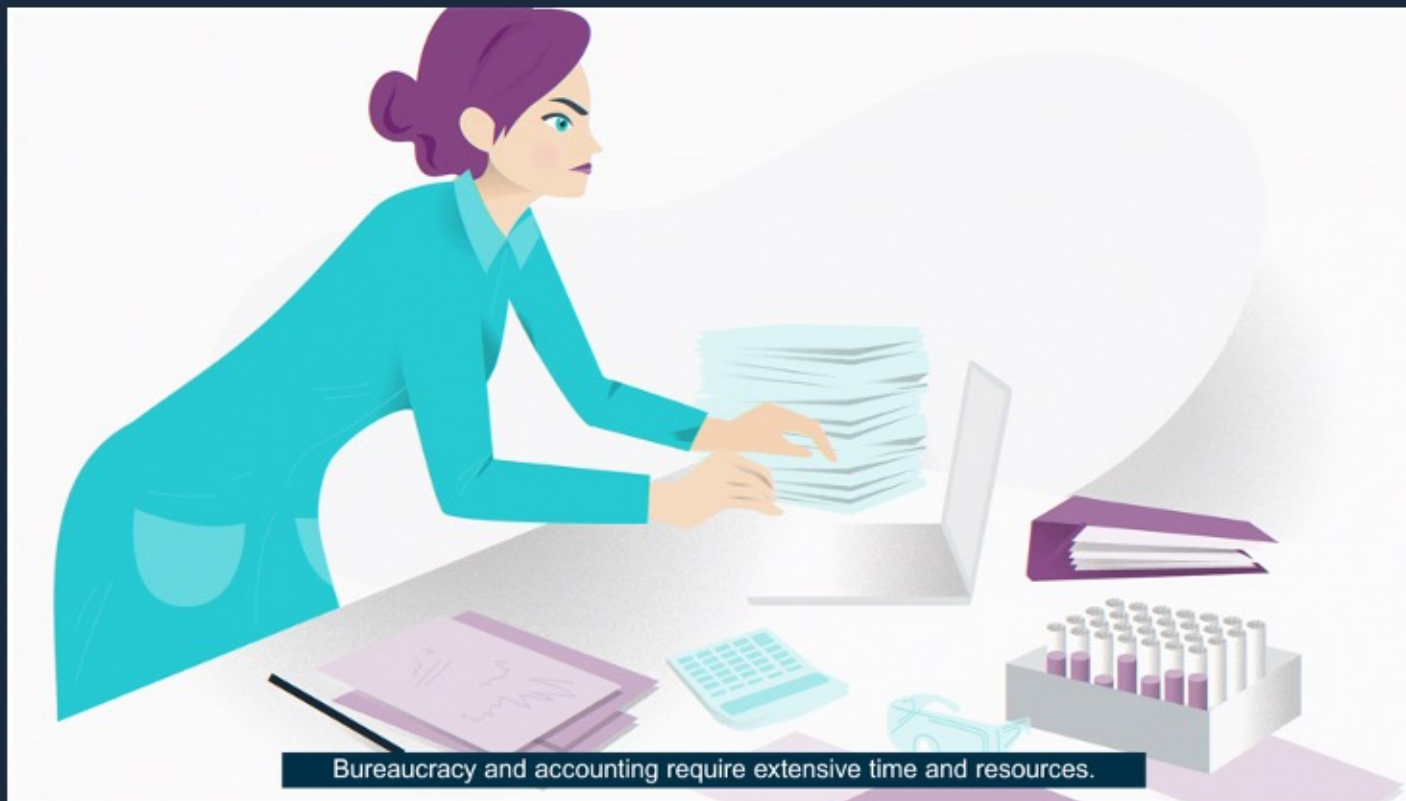

Development of digital waybills services

DigiLogistics Hack empowered by NDTPL

Real-Time Economy

Real-Time Economy

Real-time Economy (RTE) is not a specific type of economy, but a term that refers to a **information-based infrastructure** where data on economic transactions are transferred between the parties in real time.

The very goal of RTE is to carry out a structural change in the business environment and relations with the state, so that **business administration and management activities could occur automatically** in the background and significantly reduce the administrative burden on entrepreneurs.

Businesses can focus on urgent business matters, on things that **really make value for the company and increase productivity**, instead of dealing with various **time-consuming administrative activities**

DEVELOPMENT OF DIGITAL WAYBILL SERVICES

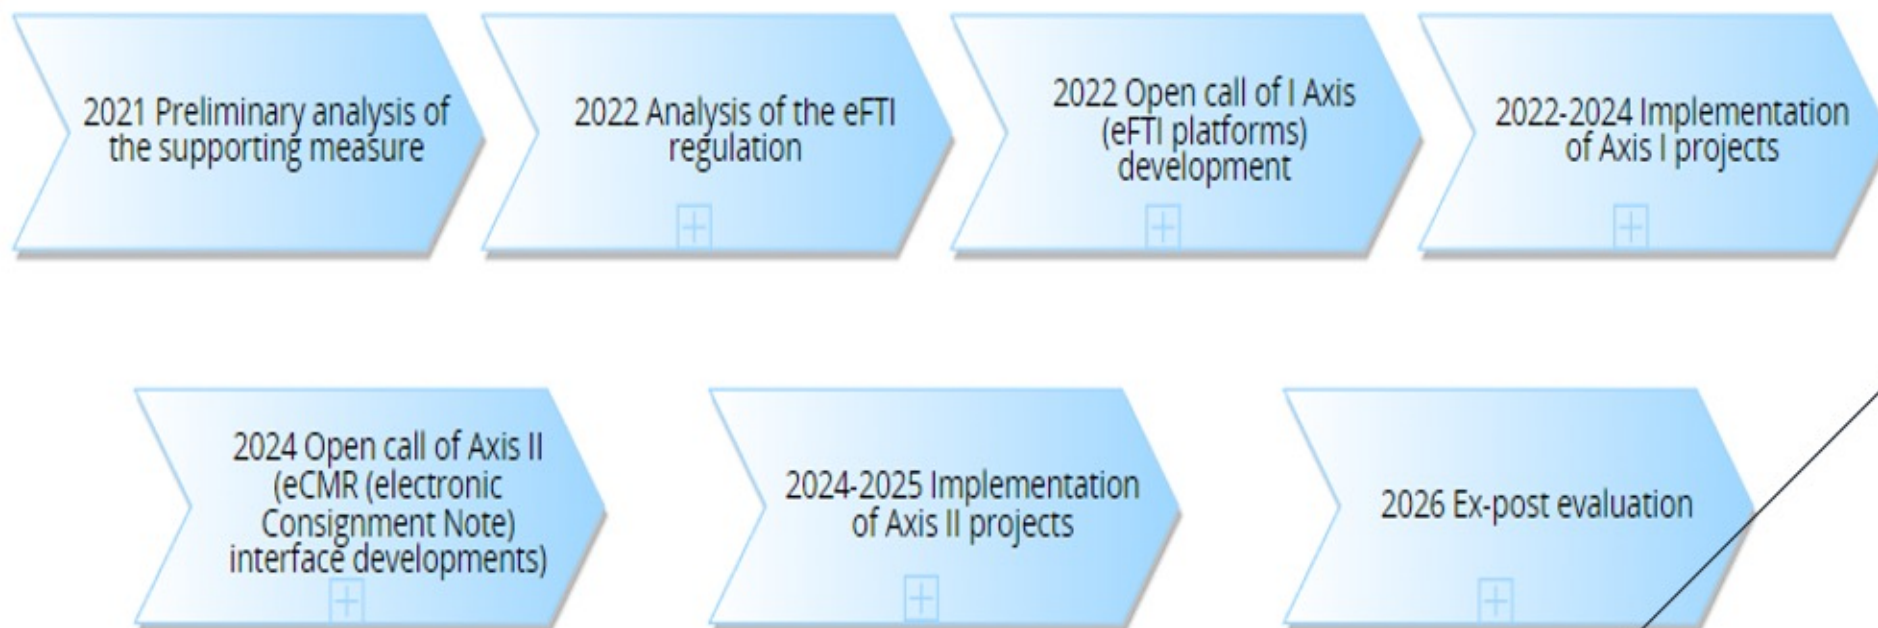

- **Objective:** to support the digitalisation of the exchange of information in road freight transport through the introduction of digital waybills
- **The Call supports:**
 - service providers in the establishment of **eFTI platforms** to enable the deployment of digital waybills (eCMR - Electronic Consignment Note)
 - transport and logistics enterprises in the interfacing of their systems and processes with the eFTI platforms, enabling them to use **digital waybills (eCMR)**
